Iowa Ambient Monitoring Network Review: 2007

Iowa Department of Natural Resources-Air Quality Bureau - Air Monitoring Group

Introduction

The purpose of this review is to compare ambient air monitoring data gathered in Iowa during the year 2007 with federal ambient air standards. These federal standards, known as National Ambient Air Quality Standards (NAAQS), have been established by the Environmental Protection Agency (EPA) for seven “criteria” pollutants: particulate matter with a diameter less than 10 microns (PM10), particulate matter with a diameter less than 2.5 microns (PM2.5), sulfur dioxide, ozone, nitrogen dioxide, carbon monoxide, and lead. Continuous monitoring methods have been approved by EPA for all monitoring methods except lead and PM2.5. Filter samplers and laboratory filter weighing procedures have been approved by EPA for both PM2.5 and PM10. All data (with the exception of carbon monoxide) summarized in this review was obtained using methods approved by EPA for comparison with the NAAQS. Carbon monoxide is monitored in Iowa with trace-level instruments that have not been approved by the EPA as a Federal Reference or Federal Equivalent Method, but have been recommended for use in quantifying low levels of carbon monoxide typical of most urban areas.

This report is divided into two parts. The first part is an executive summary, indicating where exceedances of the NAAQS were measured in Iowa during 2007. A more comprehensive review comprises the second part of the report, which includes the location and summary data for each monitor in the network.

Gaseous pollutant monitors (ozone, nitrogen dioxide, sulfur dioxide, and carbon monoxide) provide hourly values and operate 24 hours a day, seven days a week. Ozone monitors are operated only when ozone levels are highest, from April through October. Particulate filter samplers collect one filter per day and usually are not operated on successive days. Most PM10 filter based monitors are operated at a sampling frequency of one sample every sixth day, and most PM2.5 monitors are run at a frequency of one sample every third day. Some particulate monitoring sites are run at frequencies greater than these nominal frequencies if they are located in highly populated areas, near pollution sources, or if pollutant levels are close to health standards. Lead was not monitored in Iowa during the year 2007.

Incomplete data may skew the summary statistics for a monitor. In order to alert the reader to data completeness problems, monitors that were added or removed part way through the year have been indicated by an asterisk, and data completeness statistics have been provided for each monitor. If a monitor collected all of the scheduled samples, then it has an associated data completeness of 100%. If the data capture from a monitor is insufficient to compute a valid annual average according to EPA completeness criteria, then the bar representing the comparison of the annual average to the NAAQS for the monitor is hatched on the corresponding bar chart. In 2007 there were 48 NAAQS exceedances in the state of Iowa, these exceedances are detailed in this report.

Data used to create this report were gathered by three organizations under contract with the Iowa Department of Natural Resources: the University of Iowa Hygienic Laboratory, the Linn County Public Health Department, and the Polk County Public Works Air Quality Division. Contract funds were provided by US EPA, the state of Iowa legislature, and regulated industry. Air pollution data for Iowa and all other states are available online at: <http://www.epa.gov/air/data/>. Additional information on the NAAQS is available at: <http://www.epa.gov/air/criteria.html>.

2007 Exceedances of National Ambient Air Quality Standards (NAAQS) in Iowa

Pollutant	Averaging Period	Exceedance Level	Units	Number of Exceedances
Ozone	8hr	0.085	ppm	2
PM 2.5	24hr	35.5*	micrograms per cubic meter	44
	annual	15.05	micrograms per cubic meter	0
PM10	24hr	155	micrograms per cubic meter	2
Sulfur dioxide	3hr	0.55	ppm	0
	24hr	0.145	ppm	0
	annual	0.0305	ppm	0
Carbon monoxide	1hr	35.5	ppm	0
	8hr	9.5	ppm	0
Nitrogen dioxide	annual	0.0535	ppm	0
Lead	quarterly	1.55	micrograms per cubic meter	N/A***

*The 24-Hour NAAQS for PM2.5 was lowered from 65.5 to 35.5 micrograms per cubic meter, effective 12/18/2006

***Lead was not monitored in 2007

NAAQS Exceedances in Iowa Measured in 2007

2007 PM2.5 NAAQS Exceedance Locations and Dates

Sampling Frequency	1 in 3	1 in 3	daily	1 in 3	1 in 3	1 in 3	1 in 3	1 in 3	1 in 3	1 in 3	1 in 3	daily	daily	daily	daily

Appendix A

Additional Chart Information

Listed below is additional information that may be useful in interpreting the charts contained in this review

Ozone

Comparison of 2007 Ozone Data with National Ambient Air Quality Standards

This graph shows the highest eight-hour ozone average (expressed as a percentage of the 0.085 ppm eight-hour NAAQS) for each ozone monitor operated in 2007.

[Back to Chart](#)

Data Completeness-Ozone

This graph shows the total number of valid ozone monitoring days (based on 8-hour average, expressed as a percentage of the total number of days in the ozone season) for each ozone monitor operated in 2007. According to EPA guidelines, an ozone monitoring day is considered valid if at least 75% of the hourly averages for the 8-hour period are available. In the event that less than 75% of the 8-hour averages are available, a day is also counted as a valid day if the daily maximum 8-hour average for that day is greater than the NAAQS. Ozone season runs from April through October; this amounts to 214 days. An ozone monitor that recorded data for all 214 days of the ozone season would have a data capture rate of 100%.

[Back to Chart](#)

PM2.5

Comparison of 2007 PM2.5 Data with National Ambient Air Quality Standards

This graph shows the highest 24-hour value (expressed as a percentage of the 35.5 $\mu\text{g}/\text{m}^3$ 24-hour NAAQS), and the annual average (expressed as a percentage of the 15.05 $\mu\text{g}/\text{m}^3$ annual NAAQS) for each PM2.5 monitor operated in 2007.

[Back to Chart](#)

Data Completeness-PM2.5

For each PM2.5 monitor operated in 2007, this graph shows the fraction of scheduled sampling days in 2007 where a PM2.5 sample was actually collected. During 2007, PM2.5 samplers in Iowa were scheduled to operate at a sampling frequency of either one sample every third day (121 scheduled samples) or one sample each day (365 scheduled samples). The sampling frequency of each monitor is indicated in the legend of the graph.

[Back to Chart](#)

PM10

Comparison of 2007 PM10 Data with National Ambient Air Quality Standards

This graph shows the highest 24-hour value expressed as a percentage of the 155 $\mu\text{g}/\text{m}^3$ 24-hour NAAQS for each PM10 monitor operated in 2007.

[Back to Chart](#)

Data Completeness-PM10

For each PM10 monitor operated in 2007, this graph shows the fraction of scheduled sampling days in 2007 where a PM10 sample was actually collected. During 2007, PM10 samplers in Iowa were scheduled to operate at a frequency of one sample every sixth day (61 scheduled samples), one sample every third day (121 scheduled samples), one sample every other day (182 scheduled samples) or one sample each day (365 scheduled samples). The sampling frequency of each monitor is indicated in the legend of the graph.

[Back to Chart](#)

Sulfur Dioxide

Comparison of 2007 Sulfur Dioxide Data with National Ambient Air Quality Standards

This graph shows the highest 3-hour value (expressed as a percentage of the 0.55 ppm 3-hour NAAQS), the highest 24-hour value (expressed as a percentage of the 0.145 ppm 24-hour NAAQS), and the annual average (expressed as a percentage of the 0.0305 ppm annual NAAQS) for each sulfur dioxide monitor operated in 2007.

Data Completeness -Sulfur Dioxide

This graph shows total number of hourly sulfur dioxide values (expressed as a percentage of the total number of hours in 2007) for each sulfur dioxide monitor that operated in 2007. A sulfur dioxide monitor that recorded data for all 8760 hours during 2007 would have a data capture rate of 100%.

Carbon Monoxide

Comparison of 2007 Carbon Monoxide Data with National Ambient Air Quality Standards

This graph shows the highest 1-hour value (expressed as a percentage of the 35.5 ppm 1-hour NAAQS), the highest 8-hour values (expressed as a percentage of the 9.5 ppm 8-hour NAAQS) for each carbon monoxide monitor operated in 2007.

Nitrogen Dioxide

Comparison of 2007 Nitrogen Dioxide Data with National Ambient Air Quality Standards

This graph shows the annual average (expressed as a percentage of the 0.0535 ppm annual NAAQS) for each monitoring site that operated in 2007.
