~~XXXXXX~~      December 12, 1994      ~~XXXXXX~~

- Write your name on the first page, and initial the other pages.
- The response "NOTA" = "None of the above"
- Answer both parts A & B, and five sections of part C.

	Possible	Score
A. Multiple Choice	10	_____
B. Sensitivity analysis (LINDO)	15	_____
C. <b>Choose 5 of 6:</b>		
C.1. Project Scheduling	12	_____
C.2. Integer LP Models	12	_____
C.3. Discrete-time Markov chains I	12	_____
C.4. Discrete-time Markov chains II	12	_____
C.5. Birth-Death Processes	12	_____
C.6. Dynamic Programming	<u>12</u>	_____
total possible:	<u>85</u>	_____

~~XXXXXX~~      **Part A**      ~~XXXXXX~~

**Multiple Choice:** Write the appropriate letter (a, b, c, d, or e) : (NOTA = None of the above).

- \_\_\_\_\_ 1. If  $X_{ij} > 0$  in the transportation problem, then dual variables U and V *must* satisfy
 

a. $C_{ij} > U_i + V_j$	c. $C_{ij} < U_i + V_j$	e. $C_{ij} = U_i - V_j$
b. $C_{ij} = U_i + V_j$	d. $C_{ij} + U_i + V_j = 0$	f. <i>NOTA</i>
- \_\_\_\_\_ 2. If, in the optimal *dual* solution of an LP problem (min  $cx$  st  $Ax \leq b, x \geq 0$ ), variable #2 is zero, then in the optimal primal solution,
 

a. variable #2 must be zero	c. slack variable for constraint #2 must be zero
b. variable #2 must be positive	d. constraint #2 must be slack
	e. <i>NOTA</i>
- \_\_\_\_\_ 3. If, in the optimal *primal* solution of an LP problem (min  $cx$  st  $Ax \leq b, x \geq 0$ ), there is positive slack in constraint #3, then in the optimal dual solution,
 

a. dual variable #3 must be zero	c. slack variable for dual constraint #3 must be zero
b. dual variable #3 must be positive	d. dual constraint #3 must be slack
	e. <i>NOTA</i>
- \_\_\_\_\_ 4. If there is a tie in the "minimum-ratio test" of the simplex method, the solution in the next tableau
 

a. will be nonbasic	c. will have a worse objective value
b. will be nonfeasible	d. will be degenerate
	e. <i>NOTA</i>
- \_\_\_\_\_ 5. For a continuous-time Markov chain, let  $P$  be the matrix of transition rates. The sum of each...
 

a. column is 1	c. row is 1
b. column is 0	d. row is 0
	e. <i>NOTA</i>
- \_\_\_\_\_ 6. For a discrete-time Markov chain, let P be the matrix of transition probabilities. The sum of each...
 

a. column is 1	c. row is 1
b. column is 0	d. row is 0
	e. <i>NOTA</i>
- \_\_\_\_\_ 7. In PERT, the completion time for the project is assumed to
 

a. have the Beta distribution	c. be constant
b. have the Normal distribution	d. have the exponential distribution
	e. <i>NOTA</i>
- \_\_\_\_\_ 8. In an M/M/1 queue, if the arrival rate  $\lambda > \mu =$  service rate, then
 

a. $\rho = 1$ in steady state	c. $\rho_i > 0$ for all i	e. the queue is not a birth-death process
b. no steady state exists	d. $\rho_0 = 0$ in steady state	f. <i>NOTA</i>
- \_\_\_\_\_ 9. The Poisson process is a special case of the birth-death process with
 

a. no births	d. death is by Poissoning
b. no deaths	e. time between births &/or deaths has Poisson distribution
c. birth rate = death rate	f. <i>NOTA</i>

- \_\_\_\_ 10. An absorbing state of a Markov chain is one in which the probability of
- moving into that state is zero
  - moving out of that state is one.
  - moving out of that state is zero.
  - NOTA

~~XXXXX~~**Part B** ~~XXXXX~~**LINDO analysis**

*Problem Statement:* McNaughton Inc. produces two steak sauces, spicy Diablo and mild Red Baron. These sauces are both made by blending two ingredients A and B. A certain level of flexibility is permitted in the formulas for these products. Indeed, the restrictions are that:

- Red Baron must contain no more than 75% of A.
- Diablo must contain no less than 25% of A and no less than 50% of B

Up to 40 quarts of A and 30 quarts of B could be purchased. McNaughton can sell as much of these sauces as it produces at a price per quart of \$3.35 for Diablo and \$2.85 for Red Baron. A and B cost \$1.60 and \$2.05 per quart, respectively. McNaughton wishes to maximize its net revenue from the sale of these sauces.

*Define*

$D$  = quarts of Diablo to be produced  
 $R$  = quarts of Red Baron to be produced  
 $AD$  = quarts of A used to make Diablo  
 $AR$  = quarts of A used to make Red Baron  
 $BD$  = quarts of B used to make Diablo  
 $BR$  = quarts of B used to make Red Baron

The LINDO output for solving this problem follows:

```

MAX    3.35 D + 2.85 R - 1.6 AD - 1.6 AR - 2.05 BD - 2.05 BR
SUBJECT TO
2) - D + AD + BD =  0
3) - R + AR + BR =  0
4)  AD + AR <=  40
5)  BD + BR <=  30
6) - 0.25 D + AD >=  0
7) - 0.5 D + BD >=  0
8) - 0.75 R + AR <=  0
END

- \_\_\_1. If the profit on DIABLO sauce were to decrease from \$3.35 /quart to \$3.00/quart, the number of quarts of DIABLO to be produced would
  - a. increase
  - b. decrease
  - c. remain the same
  - d. insufficient info. given
  - e. *NOTA*
- \_\_\_2. The LP problem above has
  - a. exactly one optimal sol'n
  - b. exactly two optimal sol'ns
  - c. infinitely many sol'ns
  - d. no optimal solution
  - e. insufficient info. given
  - f. *NOTA*
- \_\_\_3. If an additional 8 quarts of ingredient A were available, McNaughton's profits would be
  - a. \$0.75
  - b. \$8.00
  - c. \$105.00
  - d. \$107.00
  - e. insufficient info. given
  - f. *NOTA*
- \_\_\_4. If the variable "SLK 5" were increased, this would be equivalent to
  - a. increasing A availability
  - b. decreasing A availability
  - c. increasing B availability
  - d. decreasing B availability
  - e. *NOTA*

- \_\_\_ 5. If the variable "SLK 5" were increased by 5, the quantity of DIABLO produced would be:
  - a. 35 quarts
  - b. 50 quarts
  - c. 53 quarts
  - d. 55 quarts
  - e. 65 quarts
  - f. *NOTA*
- \_\_\_ 6. If a pivot were to be performed to enter the variable SLK5 into the basis, then according to the "minimum ratio test", the value of SLK5 in the resulting basic solution would be
  - a. 16.66667
  - b. 0.06
  - c. 10.0
  - d. 0.10
  - e. 5.0
  - f. *NOTA*
- \_\_\_ 7. If the variable SLK5 were to enter the basis, then the variable leaving the basis is
  - a. A
  - b. B
  - c. AD
  - d. BD
  - e. D
  - f. R
  - g. SLK6
  - h. any of the above
  - i. more than one answer is possible
  - j. *NOTA*
- \_\_\_ 8. If the variable SLK5 were to enter the basis, then the next tableau
  - a. indicates multiple optimal sol'ns
  - b. is degenerate
  - c. both of the above
  - d. *NOTA*
- \_\_\_ 9. The dual of the LP above has an objective function which is to be
  - a. minimized
  - b. maximized
  - c. both of the above
  - d. *NOTA*
- \_\_\_ 10. The dual of the LP above has an optimal value which is
  - a. 0
  - b. 1
  - c. 99
  - d. 100
  - e. insufficient information given
  - f. *NOTA*

~~xxxxx~~ **Part C** ~~xxxxx~~

**C.1. Project Scheduling.** Consider the project with the A-O-A (activity-on-arrow) network:

- 1. Complete the labeling of the nodes on the network above.
- \_\_\_ 2. The number of activities (i.e., tasks), not including "dummies", which are required to complete this project is
  - a. six
  - b. seven
  - c. eight
  - d. nine
  - e. ten
  - f. *NOTA*

- \_\_\_\_ 4. If it is decided to produce item #1, then *at most* 100 units of item #1 may be produced.
- a.  $X_1 \leq 100Y_1$                       c.  $100X_1 \leq Y_1$                       e.  $X_1 + Y_1 \leq 100$   
b.  $100X_1 \leq Y_1$                       d.  $X_1 \leq 100Y_1$                       f. *NOTA*
- \_\_\_\_ 5. *At most one* type of item may be produced.
- a.  $X_1 + X_2 + X_3 \leq 1$                       c.  $Y_1 + Y_2 + Y_3 \leq 1$                       e.  $Y_1 + Y_2 + Y_3 \leq 2$   
b.  $X_1 + X_2 + X_3 \leq 1$                       d.  $Y_1 + Y_2 + Y_3 \leq 1$                       f. *NOTA*
- \_\_\_\_ 6. If a setup is done for *both* items #2 & #3, the machine should *not* be set up for item #1.
- a.  $2Y_1 \leq Y_2 + Y_3$                       c.  $2Y_1 = Y_2 + Y_3$                       e.  $2Y_1 \leq Y_2 + Y_3$   
b.  $Y_1 \leq Y_2 + Y_3$                       d.  $Y_1 \leq Y_2 + Y_3$                       f. *NOTA*
- \_\_\_\_ 7. At least two different item types must be produced.
- a.  $2Y_1 \leq Y_2 + Y_3$                       c.  $2Y_1 = Y_2 + Y_3$                       e.  $2Y_1 \leq Y_2 + Y_3$   
b.  $Y_1 \leq Y_2 + Y_3$                       d.  $X_1 \leq Y_2 + Y_3$                       f. *NOTA*
- \_\_\_\_ 8. The machine must be set up for at least one type of item.
- a.  $X_1 + X_2 + X_3 \leq 1$                       c.  $Y_1 + Y_2 + Y_3 \leq 1$                       e.  $Y_1 + Y_2 + Y_3 \leq 2$   
b.  $X_1 + X_2 + X_3 \leq 1$                       d.  $Y_1 + Y_2 + Y_3 \leq 1$                       f. *NOTA*
- \_\_\_\_ 9. If the machine is set up for item #1, then it should also be set up for item #2.
- a.  $Y_1 \leq Y_2$                       c.  $X_1 \leq X_2$                       e.  $Y_1 = Y_2$   
b.  $Y_1 \leq Y_2$                       d.  $X_1 \leq X_2$                       f. *NOTA*
- \_\_\_\_ 10. If a setup is done for item #1, the machine should also be set up for *both* items #2 and #3.
- a.  $2Y_1 \leq Y_2 + Y_3$                       c.  $2Y_1 = Y_2 + Y_3$                       e.  $2Y_1 \leq Y_2 + Y_3$   
b.  $Y_1 \leq Y_2 + Y_3$                       d.  $X_1 \leq Y_2 + Y_3$                       f. *NOTA*
- \_\_\_\_ 11. If a setup is done for *both* items #2 & #3, the machine should also be set up for item #1.
- a.  $2Y_1 \leq Y_2 + Y_3$                       c.  $2Y_1 = Y_2 + Y_3$                       e.  $2Y_1 \leq Y_2 + Y_3$   
b.  $Y_1 \leq Y_2 + Y_3$                       d.  $Y_1 \leq Y_2 + Y_3$                       f. *NOTA*
- \_\_\_\_ 12. If item #1 is produced, then *either* item #2 *or* item #3 (or both) must be produced.
- a.  $2Y_1 \leq Y_2 + Y_3$                       c.  $2Y_1 = Y_2 + Y_3$                       e.  $2Y_1 \leq Y_2 + Y_3$   
b.  $Y_1 \leq Y_2 + Y_3$                       d.  $X_1 \leq Y_2 + Y_3$                       f. *NOTA*

**C.3. Discrete-Time Markov Chains I** Customers buy cars from three auto companies. Given the company from which a customer last bought a car, the probability that she will buy her next car from each company is as follows:

Last Bought From	Will Buy Next From		
	Co. A	Co. B	Co. C
Company A	75%	15%	10%
Company B	5%	85%	10%
Company C	15%	5%	80%

The first several powers of the matrix (P) above, the first-passage probabilities, the mean-first-passage times, and the steadystate distribution, are:

$$P = \begin{bmatrix} 0.75 & 0.15 & 0.1 \\ 0.05 & 0.85 & 0.1 \\ 0.15 & 0.05 & 0.8 \end{bmatrix} \quad F = \begin{bmatrix} 0.75 & 0.15 & 0.1 \\ 0.05 & 0.85 & 0.1 \\ 0.15 & 0.05 & 0.8 \end{bmatrix}$$

$$P^2 = \begin{bmatrix} 0.585 & 0.245 & 0.17 \\ 0.095 & 0.735 & 0.17 \\ 0.235 & 0.105 & 0.66 \end{bmatrix} \quad F^2 = \begin{bmatrix} 0.0225 & 0.1175 & 0.09 \\ 0.0575 & 0.0125 & 0.09 \\ 0.1225 & 0.0625 & 0.02 \end{bmatrix}$$

$$P^3 = \begin{bmatrix} 0.4765 & 0.3045 & 0.219 \\ 0.1335 & 0.6475 & 0.219 \\ 0.2805 & 0.1575 & 0.562 \end{bmatrix} \quad F^3 = \begin{bmatrix} 0.020875 & 0.094375 & 0.081 \\ 0.061125 & 0.012125 & 0.081 \\ 0.100875 & 0.067625 & 0.018 \end{bmatrix}$$

$$P^4 = \begin{bmatrix} 0.40545 & 0.34125 & 0.2533 \\ 0.16535 & 0.58135 & 0.2533 \\ 0.30255 & 0.20405 & 0.4934 \end{bmatrix} \quad F^4 = \begin{bmatrix} 0.01925625 & 0.07754375 & 0.0729 \\ 0.06204375 & 0.01148125 & 0.0729 \\ 0.08375625 & 0.06825625 & 0.0162 \end{bmatrix}$$

$$\pi_A = 0.27777 \quad \pi_B = 0.38888 \quad \pi_C = 0.33333 \quad \pi = \begin{bmatrix} 3.6 & 8.5714286 & 10 \\ 12 & 2.5714286 & 10 \\ 8 & 11.428571 & 3 \end{bmatrix}$$

Suppose that "Jane Doe" buys a new car from company C in 1994, and replaces her car *every year!* **In the multiple choices below, choose the number nearest to the correct answer.**

- \_\_\_ 1. What is the probability that Jane's *next* car (i.e., in 1995) is a Company A car?
  - a. 5%                      c. 15%                      e. 25%                      g. 70%                      i. 80%                      k. 90%
  - b. 10%                     d. 20%                     f. 30%                     h. 75%                     j. 85%                     l. 95%
- \_\_\_ 2. What is the probability that the car which Jane purchases in 1996 is a Company A car?
  - a. 5%                      c. 15%                      e. 25%                      g. 70%                      i. 80%                      k. 90%
  - b. 10%                     d. 20%                     f. 30%                     h. 75%                     j. 85%                     l. 95%
- \_\_\_ 3. What is the probability that *at least one* of the next two cars which Jane buys will be a Company A car?
  - a. 5%                      c. 15%                      e. 25%                      g. 70%                      i. 80%                      k. 90%
  - b. 10%                     d. 20%                     f. 30%                     h. 75%                     j. 85%                     l. 95%
- \_\_\_ 4. What is the probability that the first Company A car which Jane buys will be in 1997?
  - a. 5%                      c. 15%                      e. 25%                      g. 70%                      i. 80%                      k. 90%
  - b. 10%                     d. 20%                     f. 30%                     h. 75%                     j. 85%                     l. 95%
- \_\_\_ 5. What is the expected number of years until Jane buys a Company A car?
  - a. 1                        c. 3                        e. 5                        g. 7                        i. 9                        k. 11
  - b. 2                        d. 4                        f. 6                        h. 8                        j. 10                      l. 12
- \_\_\_ 6. Over a "long" period of time, which company would you expect to have the *largest* market share?
  - a. Company A            c. Company C            e. All 3 share equally
  - b. Company B            d. Both Co. A & C equal   f. *NOTA*
- \_\_\_ 8. The number of *transient* states in this Markov chain model is
  - a. 0                        c. 2                        e. 9
  - b. 1                        d. 3                        f. *NOTA*
- \_\_\_ 9. The number of *recurrent* states in this Markov chain model is
  - a. 0                        c. 2                        e. 9
  - b. 1                        d. 3                        f. *NOTA*
- \_\_\_ 10. The probabilities in a Markov chain transition matrix are
  - a. simple probabilities.            c. conditional probabilities.
  - b. joint probabilities.              d. more than one of the above are correct.            e. *NOTA*
- \_\_\_ 11. The steady-state probability vector of a discrete Markov chain with transition probability matrix P satisfies the matrix equation
  - a.  $P^t = 0$                       c.  $(I+P) = 0$                       e.  $P =$                       g.  $P = 0$
  - b.  $P = 0$                       d.  $(I+P) = 0$                       f.  $P =$                       h. *NOTA*
- \_\_\_ 12. The equations to be solved for the steadystate probabilities include:
  - a.  $0.1 A + 0.1 B + 0.8 C = A$             c.  $0.15 A + 0.05 B + 0.8 C = C$             e.  $A + B + C = 0$
  - b.  $0.1 A + 0.1 B + 0.8 C = C$             d.  $0.1 A + 0.1 B + 0.8 C = 0$             f. *NOTA*

**C.4. Discrete-Time Markov Chains II** A baseball team consists of 2 stars, 13 starters, and 10 substitutes. For tax purposes, the team owner must place a value on the players. The value of each player is defined to be the total value of the salary he will earn until retirement. At the beginning of each season, the players are classified into one of four categories:

**Category 1:** Substitute (earns \$100,000 per year).

**Category 2:** Starter (earns \$400,000 per year).

**Category 3:** Star (earns \$1 million per year).

**Category 4:** Retired while not a star (earns no more salary).

**Category 5:** Retired while Star (earns no salary, but is paid \$100,000/year for product endorsements).

Given that a player is a star, starter, or substitute at the beginning of the current season, the probabilities that he will be a star, starter, substitute, or retired at the beginning of the next season are shown in the transition probability matrix  $P$  below. Also shown are a diagram of the Markov chain model of a "typical" player, several powers of  $P$ , the first-passage probability matrices, the absorption probabilities, and the matrix of expected number of visits.

$$P = \begin{bmatrix} 0.5 & 0.15 & 0.05 & 0.3 & 0 \\ 0.2 & 0.5 & 0.2 & 0.1 & 0 \\ 0.15 & 0.3 & 0.45 & 0 & 0.1 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix} \quad F = \begin{bmatrix} 0.5 & 0.15 & 0.05 & 0.3 & 0 \\ 0.2 & 0.5 & 0.2 & 0.1 & 0 \\ 0.15 & 0.3 & 0.45 & 0 & 0.1 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

$$P^2 = \begin{bmatrix} 0.2875 & 0.165 & 0.077 & 0.465 & 0.005 \\ 0.23 & 0.34 & 0.2 & 0.21 & 0.02 \\ 0.2025 & 0.307 & 0.27 & 0.075 & 0.145 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix} \quad F^{(2)} = \begin{bmatrix} 0.0375 & 0.09 & 0.055 & 0.165 & 0.005 \\ 0.13 & 0.09 & 0.11 & 0.11 & 0.02 \\ 0.1275 & 0.157 & 0.067 & 0.075 & 0.045 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

$$P^3 = \begin{bmatrix} 0.188 & 0.148 & 0.082 & 0.567 & 0.012 \\ 0.213 & 0.264 & 0.169 & 0.313 & 0.04 \\ 0.203 & 0.265 & 0.193 & 0.166 & 0.172 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix} \quad F^{(3)} = \begin{bmatrix} 0.0258 & 0.0528 & 0.044 & 0.1027 & 0.007 \\ 0.0905 & 0.0495 & 0.066 & 0.103 & 0.02 \\ 0.0963 & 0.0843 & 0.041 & 0.0915 & 0.027 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

$$P^4 = \begin{bmatrix} 0.136 & 0.127 & 0.076 & 0.639 & 0.020 \\ 0.184 & 0.215 & 0.139 & 0.403 & 0.056 \\ 0.183 & 0.220 & 0.150 & 0.253 & 0.191 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix} \quad F^{(4)} = \begin{bmatrix} 0.018 & 0.030 & 0.031 & 0.071 & 0.008 \\ 0.064 & 0.027 & 0.041 & 0.090 & 0.016 \\ 0.070 & 0.045 & 0.026 & 0.087 & 0.019 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

$$A = \begin{matrix} & \begin{matrix} 4 & 5 \end{matrix} \\ \begin{matrix} 1 \\ 2 \\ 3 \end{matrix} & \begin{bmatrix} 0.93103 & 0.068966 \\ 0.86207 & 0.13793 \\ 0.72414 & 0.27586 \end{bmatrix} \end{matrix} \quad E = \begin{matrix} & \begin{matrix} 1 & 2 & 3 \end{matrix} \\ \begin{matrix} 1 \\ 2 \\ 3 \end{matrix} & \begin{bmatrix} 2.6959 & 1.2226 & 0.68966 \\ 1.7555 & 3.3542 & 1.3793 \\ 1.6928 & 2.163 & 2.7586 \end{bmatrix} \end{matrix}$$

Suppose that at the beginning of the 1994 season, Joe Blough was a Starter (category #2).

Select the **nearest** available numerical choice in answering the questions below.

- \_\_\_ 1. The number of *transient* states in this Markov chain model is
 

a. 0	c. 2	e. 4	g. <i>NOTA</i>
b. 1	d. 3	f. 5	
- \_\_\_ 2. The number of *recurrent* states in this Markov chain model is
 

a. 0	c. 2	e. 4	g. <i>NOTA</i>
b. 1	d. 3	f. 5	
3. The closed sets of states in this Markov chain model are (circle all that apply!)
 

a. {1}	d. {4}	g. {1,2,3}	j. {3,4,5}
b. {2}	e. {5}	h. {1,2,3,4}	k. {2,3,4,5}
c. {3}	f. {1,2}	i. {4,5}	l. <i>NOTA</i>
4. The *minimal* closed sets of states in this Markov chain model are (circle all that apply!)
 

a. {1}	d. {4}	g. {1,2,3}	j. {3,4,5}
b. {2}	e. {5}	h. {1,2,3,4}	k. {2,3,4,5}
c. {3}	f. {1,2}	i. {4,5}	l. <i>NOTA</i>
- \_\_\_ 5. What is the probability that Joe is a star in 1995? (choose nearest answer)
 

a. 5%	c. 15%	e. 25%	g. 35%	i. 45%
b. 10%	d. 20%	f. 30%	h. 40%	j. 50%
- \_\_\_ 6. What is the probability that Joe is a star in 1996? (choose nearest answer)
 

a. 5%	c. 15%	e. 25%	g. 35%	i. 45%
b. 10%	d. 20%	f. 30%	h. 40%	j. 50%
- \_\_\_ 7. What is the probability that Joe *first* becomes a star in 1996? (choose nearest answer)
 

a. 5%	c. 15%	e. 25%	g. 35%	i. 45%
b. 10%	d. 20%	f. 30%	h. 40%	j. 50%
- \_\_\_ 8. What is the probability that Joe *eventually* becomes a star before he retires? (choose nearest answer)
 

a. 5%	c. 15%	e. 25%	g. 35%	i. 45%
b. 10%	d. 20%	f. 30%	h. 40%	j. 50%
- \_\_\_ 9. What is the expected length of his playing career, in years? (choose nearest answer)
 

a. 1 year	c. 3 years	e. 5 years	g. 7 years	i. 9 years
b. 2 years	d. 4 years	f. 6 years	h. 8 years	j. <i>NOTA</i>
- \_\_\_ 10. What fraction of players who achieve "stardom" retire while still a star? (choose nearest answer)
 

a. 10%	c. 30%	e. 50%	g. 70%	i. 90%
b. 20%	d. 40%	f. 60%	h. 80%	j. 100%

**C.5. Birth-Death Processes** For each birth-death model of a queue in diagrams (1) through (8) below, indicate the correct Kendall's classification from among the following choices. (Note that some classifications might not be matched with any birth-death diagram, while others might be matched to more than one!)

- |              |            |              |                |
|--------------|------------|--------------|----------------|
| a. M/M/1     | d. M/M/2   | g. M/M/1/4   | j. M/M/2/3     |
| b. M/M/4     | e. M/M/2/4 | h. M/M/2/4/4 | k. M/M/2/2/4   |
| c. M/M/1/2/4 | f. M/M/4/2 | i. M/M/4/4   | l. <i>NOTA</i> |

Two mechanics work in an auto repair shop, with a capacity of 3 cars. If there are 2 or more cars in the shop, each mechanic works individually, each completing the repair of a car in an average of 4 hours (the actual time being random with exponential distribution). If there is only one car in the shop, both mechanics work together on it, completing the repair in an average time of 3 hours (also exponentially distributed). Cars arrive randomly, according to a Poisson process, at the rate of one every two hours when there is at least one idle mechanic, but one every 3 hours when both mechanics are busy. If 3 cars are in the shop, no cars arrive.

9. Choose the transition diagram below corresponding to this system.

g. *NOTA*

The steady-state probabilities for this system are:  $p_0=20%$ ,  $p_1=30%$ ,  $p_2=30%$ , &  $p_3=20%$ .

9. What fraction of the day will both mechanics be idle?

- a. 10%
- b. 20%
- c. 30%
- d. 40%
- e. 50%
- f. 60%
- g. 70%
- h. *NOTA*

10. What fraction of the day will both mechanics be working on the same car?

- a. 10%
- b. 20%
- c. 30%
- d. 40%
- e. 50%
- f. 60%
- g. 70%
- h. *NOTA*

11. What is the average number of cars in the shop? (Choose nearest answer.)

- a. 0.5
- b. 0.75
- c. 1.0
- d. 1.25
- e. 1.5
- f. 1.75
- g. 2.0
- h. 2.5

- \_\_\_\_ 12. If an average of 2.8 cars arrive during an 8-hour day, then according to Little's Law, the average time spent by a car in the repair shop is (choose nearest answer)
- a. 3.0 hours      c. 3.5 hours      e. 4.0 hours      g. 4.5 hours  
 b. 3.25 hours    d. 3.75 hours    f. 4.25 hours    h. 4.75 hours

**C.6. Dynamic Programming. Match Problem.** Suppose that there are 15 matches originally on the table, and you are challenged by your friend to play this game. Each player must pick up either 1, 2, or 3 matches, with the player who picks up the last match paying \$1.

Define  $F(i)$  to be the **minimal cost** to you (either \$1 or \$0) if

- it is your turn to pick up matches, and
- $i$  matches remain on the table.

Thus,  $F(1) = 1$ ,  $F(2) = 0$  (since you can pick up one match, forcing your opponent to pick up the last match), etc.

- \_\_\_\_ 1. What is the value of  $F(3)$ ?
- \_\_\_\_ 2. What is the value of  $F(4)$ ?
- \_\_\_\_ 3. What is the value of  $F(6)$ ?
- \_\_\_\_ 4. What is the value of  $F(15)$ ?
- \_\_\_\_ 5. If you are allowed to decide whether you or your friend should take the first turn, what is your optimal decision?
- a. You take first turn      c. You are indifferent about this choice  
 b. Friend takes first turn    d. You refuse to play the game

**Auto Replacement Problem.** Suppose that a new car costs \$15,000 and that the annual operating cost and resale value of the car are as shown in the table below:

Age of Car (years)	Resale Value	Operating Cost in year ending
1	\$11000	\$400 (year 1)
2	\$9000	\$600 (year 2)
3	\$7500	\$900 (year 3)
4	\$5000	\$1200 (year 4)
5	\$4000	\$1600 (year 5)
6	\$3000	\$2200 (year 6)

(The operating cost specified above is for the year which is ending; thus, the cost of operating a car its first year is \$400, for its second year the cost is \$600, etc.) If I have a new car now (time 0, and this initial car is assumed to be "free", i.e. a "sunk" cost), I wish to determine a replacement policy that minimizes my net cost of owning and operating a car for the next six years.

Define  $G(t)$  = minimum cost of owning and operating car(s) through the end of the sixth year, **given that I have a new car at the end of year  $t$ .**

(As in the example solved in class, this includes the cost of the replacement car if I trade in my current car before the end of the sixth year, but does not include the cost of the car which is new at the beginning of this period.)

The optimal solution is shown below, with the value of  $G(0)$  & initial replacement time omitted:

- \_\_\_ 6. The value of  $G(5)$ , i.e., the cost for the final year if I have a new car at the end of year 5, is
- 0
  - \$400
  - \$2200
  - $\$400 - 11000 = -\$10600$
  - $\$11000 - 2200 = \$8800$
  - $\$11000 - 400 = \$10600$
  - NOTA
- \_\_\_ 7. If I have a new car at the end of year 4 and replace it after one year, my cost for the remainder of the six-year period is
- \$400
  - \$1000
  - \$8000
  - $\$400 + 4000 - 10600 = -\$6200$
  - $\$2200 - 10600 = -\$8400$
  - $\$1600 - 10600 = -\$9000$
  - $\$400 - 10600 = -\$10200$
  - $\$1600 + 4000 = \$5600$
  - NOTA
- \_\_\_ 8. If I have a new car at the end of year 4 and keep it until the end of the sixth year, my cost for that period is
- \$600
  - \$1000
  - \$1600
  - $\$1600 - 3000 = -\$1400$
  - $\$1000 + 6000 - 9000 = -\$2000$
  - $\$600 - 3000 = -\$2000$
  - $\$400 - 3000 = -\$2600$
  - $\$1000 - 9000 = -\$8000$
  - NOTA
- \_\_\_ 9. If I have a new car at the end of year 2, how old will it be when I should replace it?
- 1 year old
  - 2 years old
  - 3 years old
  - 4 years old
  - 5 years old
  - 6 years old
- \_\_\_ 10. If I have a new car at the end of year 0 (beginning of year 1) and replace it at the end of the first year, my total cost for the six-year period is
- \$400
  - \$700
  - $\$400 + 700 = \$1100$
  - $\$400 + 4000 = \$4400$
  - $\$400 + 4000 + 700 = \$5100$
  - $\$600 + 700 = \$1300$
  - $\$400 + 15000 = \$15400$
  - $\$700 + 15000 - 11000 = \$4700$
  - NOTA
- \_\_\_ 11. If I have a new car at the end of year 0 (beginning of year 1) and replace it at the end of the second year, my total cost for the six-year period is
- \$600
  - $\$400 + 600 = \$1000$
  - $\$400 + 700 = \$1100$
  - $\$1000 - 1800 = -\$800$
  - $\$600 - 1800 = -\$1200$
  - $\$1000 + 6000 - 1800 = \$5200$
  - $\$600 + 15000 - 1800 = \$14800$
  - $\$700 + 15000 - 9000 = \$6700$
  - NOTA
- \_\_\_ 12. If I have a new car at the end of year 0 (beginning of year 1) and keep my original car until the end of the sixth year, my total cost for the six-year period is
- $\$400 + 600 + 900 + 1200 + 1600 + 2200 - 3000 = \$3900$
  - $\$400 + 600 + 900 + 1200 + 1600 + 2200 = \$6900$
  - $\$15000 + 400 + 600 + 900 + 1200 + 1600 + 2200 - 3000 = \$18900$
  - $\$700 + 1800 + 5600 + 8000 + 10600 + 0 = \$26700$
  - NOTA
