| Dead Zone | (c $\tau$ )/2 |
| :---: | :---: |
| Range Resolution | $\Delta R=c \tau / 2$ |
| PRF | Pulse Repetition Frequency |
| PRI | Pulse Repetition Interval = 1/PRF |
| Unambiguous range | $c /(2 P R F)$ |
| Doppler shift | $f_{d}=\frac{2 V_{r}}{\lambda}$ |
| Unambiguous velocity | $V_{\max }=\frac{\lambda P R F}{4}$ |
| Doppler dilemma | $V_{\text {max }} R_{\text {max }}=\frac{c \lambda}{8}$ |
| Definition of radar reflectivity $\eta\left(\mathrm{m}^{2} \mathrm{~m}^{-3}\right)$ | $\eta=\sum_{\text {Unit Volume }} \sigma_{i}$ |
| Radar reflectivity $\eta\left(\mathrm{m}^{2} \mathrm{~m}^{-3}\right)$ | $\sigma_{t}=V \sum_{\text {Unit Volume }} \sigma_{i}=V \eta$ |
| Definition of radar reflectivity factor $z\left(\mathrm{~mm}^{6} / \mathrm{mm}^{3}\right)$ | $z=\sum_{\text {UnitVolume }} D^{6}$ |
| Radar equation with incorporating simplified "lobing" | $P_{r}=\frac{G^{2} \lambda^{2} P_{t} \sigma}{64 \pi^{3} R^{4}} \times 16 \sin ^{4}\left(\frac{2 \pi h_{a} h_{t}}{\lambda R}\right)$ |
| Radar equation with incorporating simplified "lobing" in region below first peak | $P_{r}=\approx \frac{4 \pi P_{t} G^{2} \sigma\left(h_{a} h_{t}\right)^{4}}{\lambda^{2} R^{8}}$ |
| Definition of refractivity | $N=(n-1) \cdot 10^{6}$ where $n$ is the index of refraction |
| Distance to horizon (linear model of refractivity) | $d=\sqrt{2 k a h}_{a}$ (Consistent Units) $d(k m)=4.12 \sqrt{h_{a}}(m)$ <br> where $a=$ diameter of earth, $h_{a}$ is the antenna height and $k=4 / 3$ |
| Speed of radio wave | $c=\sqrt{\frac{\mu}{\varepsilon}}=\sqrt{\frac{\mu_{0}}{\varepsilon_{0}}} \sqrt{\frac{\mu_{r}}{\varepsilon_{r}}}=c \sqrt{\frac{u_{r}}{\varepsilon_{r}}} \propto c \sqrt{\frac{1}{\varepsilon_{r}}}$ |

## General Antenna Formulas

$G=$ Antenna Gain
$\lambda=$ Wavelength (m)
$A_{e}=\frac{G \lambda^{2}}{4 \pi} \quad$ Antenna Effective Area $\left(\mathrm{m}^{2}\right)$
$G=\frac{\pi^{2} k^{2}}{\theta \phi} \quad \theta, \phi$ are H and V beamwidths (radians), $k$ antenna factor
$G=\frac{\pi^{2}}{\theta^{2}} \quad$ For circular antennas, $\theta$ beamwidth (radians)

## Parabolic Dish Antennas

$\theta=\frac{70 \lambda}{D} \quad$ Beamwidth in degrees, $D=$ dish diameter । $\theta=\frac{\lambda}{D} \quad$ Beamwidth in radians

## Radar Equation for Point Targets

$$
P_{r}=\frac{G^{2} \lambda^{2} P_{t} \sigma}{64 \pi^{3} R^{4}}
$$

$P_{t}$ and $P_{r}$ are transmitted and received power, $\sigma$ is
the radar target cross sectional area, $R$ is the
distance between target and transmitter, and $G$ is
the antenna gain.

## Radar Equation for Distributed Targets

$$
P_{r}=\frac{G^{2} \lambda^{2} P_{t} V \eta}{64 \pi^{3} R^{4}} \quad \begin{aligned}
& P_{t} \text { is the transmitted and received power, } \eta \\
& \text { is the radar target cross sectional area, } R \text { is } \\
& \text { the distance between target and transmitter, } \\
& \text { and } G \text { is the antenna gain. } V \text { is the radar } \\
& \text { pulse volume (see below) }
\end{aligned}
$$

## Radar Pulse Volumes

$$
\begin{aligned}
& \begin{array}{l|l}
V_{1}=\pi \frac{R \theta}{2} \frac{R \phi}{2} \frac{h}{2} \text { (general) } & \begin{array}{l}
h=\text { pulse length, } \tau \text { is the pulse width, } \theta \text {, and } \phi \\
\text { are antenna beam widths. }
\end{array}
\end{array} \\
& V_{2}=\frac{\pi R^{2} \theta^{2} h}{8}(\text { symetric } \theta=\varphi) \\
& V_{3}=\frac{\pi R^{2} \theta \varphi}{8 \ln (2)} \frac{h}{2} \text { (symectric, Gaussian) } \\
& P_{r}=\left(\frac{G^{2} \lambda^{2} P_{t} \theta \phi c \tau}{1024 \ln (2) \pi^{2}}\right) \frac{\eta}{R^{2}}=C \frac{\eta}{R^{2}} \\
& \text { Radar equation for distributed targets using } \\
& \text { symmetric Gaussian antenna. } C \text { is the radar } \\
& \text { constant. }
\end{aligned}
$$

Attenuation of electromagnetic energy in the atmosphere. Solid curve is due to absorption by oxygen. Dashed curve is due to absorption by water vapor.
